

Long-run continued success of New Mexico's commercial onion crop will, as always, depend upon the profitability of the crop in any or all of its various forms. Table 1 presents typical costs and returns of producing onions in the primary producing areas of New Mexico. These estimates provide comparisons that can be used by current and prospective onion producers and processors to assess the profitability of onion production.

Onions are one of the top ten commodities grown in New Mexico. New Mexico produces three separate onion crops that differ in their harvest times: fall, mid-season, and spring. Onions are primarily grown in the southern counties of the state. Supplies peak in early June and July as fall-planted onions mature. Unlike onions grown in northern states, which are stored over the winter, New Mexico's crop goes straight to stores, mostly in southern and eastern states. New Mexico's onions are sold as fresh-market onions, but a portion of the crop is also used for onion rings and frozen products. Regardless of the end use of the onion, the crop must provide an adequate return to cover all of the producer's costs.

Obtaining a higher price or reducing costs can generate increased profit. The cost-return relationship must be examined carefully by every producer of every commodity, whether in agricultural, manufacturing, or service industries. Because of the economic structure of agriculture markets, cost and return relationships are particularly important. The basic building blocks of cost and return analyses are enterprise cost and return estimates (CAREs), which are later organized and compiled into other budgets, including whole farm, partial, and cash flow budgets. An enterprise CARE includes all costs

and returns associated with producing an enterprise in some particular manner. Enterprise CAREs are constructed on a per-unit basis, such as per acre, to make a workable comparison among alternative enterprises. An enterprise is any activity that results in a product used on the farm or sold in the market, and a farm can be made up of any one or many enterprises. Each enterprise requires a certain combination of resources, such as land, labor, machinery, capital, and purchased inputs.

Enterprise CAREs can estimate costs and returns on enterprises currently in the farm plan, as well as new enterprises being considered. Most enterprise CAREs also list physical resources needed for production, which is useful information for prospective new producers of a commodity. In addition to producers, many other professionals in agriculture find enterprise CAREs to be valuable information sources. These include lenders, assessors and appraisers, consultants, and lawyers. The New Mexico State University Cooperative Extension Service publishes representative CAREs for various regions of the state annually. These enterprise budgets represent typical costs and returns for a given size and method of production in a particular region of the state. The CAREs are not averages, but represent typical situations.

NMSU CAREs represent current conditions for farming situations where management is above average. Adjusting these CAREs for prices and yields expected in the future would increase their value as decision-making tools. Projections based on a farm's unique set of conditions would be most valuable. Some items can be modified easily to build more personalized CAREs. Quantities and prices of purchased inputs, yields and prices of crops, fuel

**Table 1. Costs and Returns for Producing Onions in New Mexico for 2008**

County Area	Doña Ana/Sierra	Luna	Doña Ana/Sierra	Luna	Doña Ana/Sierra	Luna
Variety	Fall	Fall	Mid-season	Mid-season	Sweet Spanish	Late
Marketing System	Wholesale	Wholesale	Wholesale	Wholesale	Wholesale	Wholesale
<b>Yield</b>						
Fall Units	1,200 Sacks	820 Sacks				
Midseason Units			675 Sacks	670 Sacks		
Late Units					825 Sacks	820 Sacks
Price Fall	\$6.81	\$7.01				
Price Mid-season			\$7.21	\$7.21		
Price Late					\$6.97	\$6.97
<b>Gross Returns</b>	\$8,172.00	\$5,748.20	\$4,866.75	\$4,830.70	\$5,750.25	\$5,715.40
<b>Cash Operating Expenses</b>						
Seed	\$405.00	\$270.00	\$660.00	\$660.00	\$660.00	\$660.00
Fertilizer	\$515.50	\$273.38	\$382.50	\$273.38	\$382.50	\$259.25
Chemicals	\$196.12	\$107.11	\$140.59	\$140.94	\$140.51	\$140.94
Crop Insurance						
Other Purchased Inputs						
Canal Water	\$109.67		\$99.00		\$109.67	
Fuel & Lubricants—Equipment	\$74.06	\$70.18	\$66.84	\$68.43	\$66.84	\$68.43
Fuel—Irrigation	\$0.05	\$158.58	\$0.05	\$135.93	\$0.05	\$135.93
Repairs	\$24.91	\$20.12	\$22.56	\$19.53	\$22.56	\$19.53
Custom Charges	\$5,128.81	\$3,580.67	\$2,993.84	\$2,973.09	\$3,598.35	\$3,577.72
Land Taxes	\$8.54	\$1.80	\$8.54	\$1.80	\$8.54	\$1.80
Other Expenses	\$73.06	\$67.31	\$73.06	\$67.31	\$73.06	\$67.31
<b>Total Cash Expenses (B)</b>	\$6,535.72	\$4,549.15	\$4,446.98	\$4,340.41	\$5,062.08	\$4,930.91
<b>Return Over Cash Expenses (C = A - B)</b>	\$1,636.28	\$1,199.05	\$419.77	\$490.29	\$688.17	\$784.49
<b>Fixed Expenses (D)</b>	\$63.12	\$94.43	\$58.99	\$87.16	\$59.30	\$87.16
<b>Total Expenses (E = B + D)</b>	\$6,598.84	\$4,643.58	\$4,505.97	\$4,427.57	\$5,121.38	\$5,018.07
<b>Net Farm Income (F = A - E = C - D)</b>	\$1,573.16	\$1,104.62	\$360.78	\$403.13	\$628.87	\$697.33
<b>Labor and Management Costs (G)</b>	\$291.80	\$252.27	\$277.76	\$291.43	\$291.58	\$290.02
<b>Net Operating Profit (H = F - G)</b>	\$1,281.36	\$852.35	\$83.02	\$111.70	\$337.29	\$407.31
<b>Capital Costs</b>						
Interest on Operating Capital (I)	\$85.06	\$51.94	\$73.25	\$63.96	\$77.56	\$67.31
Interest on Equipment Investment (J)	\$35.92	\$28.93	\$33.98	\$28.22	\$33.98	\$28.22
<b>Total Capital Costs (K = I + J)</b>	\$120.98	\$80.87	\$107.23	\$92.18	\$111.54	\$95.53
<b>Return to Land and Risk (L = H - K)</b>	\$1,160.38	\$771.48	(\$24.21)	\$19.52	\$225.75	\$311.78

\*(Letters in parentheses refer to definitions in the Glossary)

costs, and labor costs may be readily adapted to individual farms. Another example of a modification to these CAREs is to analyze each operation performed on each crop. If these operations are performed in a different pattern, the CAREs should be changed. Yields and prices of the crops are highly variable from year to year. In analyzing historical budgets for use in forward planning, the astute manager will decide how much risk can be adsorbed and will select cropping patterns accordingly. In forward planning, the manger should consider both optimistic and pessimistic price and yield combinations to account for risk, and should consider crop rotation plans.

The effect of the various costs on planning decisions and business analyses is very important. These estimates present a *full-cost* approach to enterprise analysis. Many of the costs are opportunity costs; that is, they are real costs of doing business, but may not be cash expenditures. For example, if all labor is provided by the operator, then the entire amount listed in these estimates is money that can be kept by the operator—it represents a return to operator and family labor. Similarly, all land and all capital is charged at competitive rates regardless of whether land is rented or owned or whether capital is borrowed or owned.

The key to interpreting the “bottom-line” figure calculated in these estimates lies in the type of decision at hand. For next year’s crop, the important point is the level of gross margins (the returns minus all cash expenses). Can enough cash be generated to meet reasonable family living needs and to cover all financial debt commitments? In the long run, all expenses must be covered (of particular importance when trying to determine whether to buy a farm). In the short run, a negative net income is not desirable, but it may not necessarily be enough to cause business failure. For a short while, depreciation and other non-cash costs can provide a cushion to allow producers additional financial flexibility.

CAREs like these are updated annually. More detailed estimates and a guide to using the CAREs (NMSU Extension publications 400 Z-32) may be obtained from each county Extension Farm Management Specialist.

## GLOSSARY

**Depreciation expense:** Annual allowance for the deterioration of an asset whose productive life is more than one year. Depreciation is not paid in cash, but is an expense to the business since the purchase price of a long-lived asset cannot and should not be deducted in any one year.

**Enterprise cost and return estimate:** A detailed full-cost listing of all returns and costs (whether paid or unpaid) associated with a particular crop or livestock enterprise.

**Fixed costs:** Expenses that do not vary with the level of production, such as depreciation and personal property taxes. For example, personal property taxes are the same on a tractor regardless of whether that tractor is used on one acre or 300 acres. (Line E)

**Gross margins:** Returns minus variable costs; the most important short-run planning figure.

**Gross returns:** Total cash receipts from a crop, i.e., total yield times price. (Line A)

### **Interest on operating capital and equipment**

**investment:** A calculated cost, or opportunity cost, on the use of capital in the farm business. For some farmers, interest cost will be an outlay, while for others it will be an imputed cost. (Lines I and J)

**Net farm income:** Returns to labor management, capital, land, and risk, i.e., gross returns minus purchased inputs, fuel, oil, lubricants, repairs, and fixed costs. (Line F)

**Net operating profit:** Gross returns minus total operating expenses. (Line H)

**Operating capital:** Operating expenses minus fixed costs, i.e., the amount of cash required for all purchased inputs (including labor, fuel, oil, and repairs) to produce a crop, without regard to machinery, equipment, or land investments.

**Operating expenses:** The total of all costs of producing a crop, except interest.

**Opportunity cost:** The cost of using a resource in one enterprise when it could be used in alternative enterprises or investment opportunities, measured by the return that could be obtained from using the resource in an alternative investment. For example, if cash used in crop production could be placed in the bank at a 10% rate of interest, the opportunity cost of cash to the crop would be 10%.

**Overhead expenses:** Expenses not directly associated with production, such as insurance, employee benefits, land taxes, and utilities. These costs occur without regard to level of production, or whether production exists at all.

**Partial budgeting:** A planning procedure that lists only items of receipts and expenses that are affected by a particular change in procedure or organization.

**Rate of return on investment:** Net operating profit divided by the total machinery, equipment, and land investment. A measure of profitability of assets in percentage terms.

**Return over cash expense:** Gross returns less all cash operating expenses. (Line C = A - B)

**Return to capital, labor, land, and risk:** Charges for the listed factors of capital, labor, and land have not yet been subtracted from gross returns. Typically, these three factors are owned.

**Return to land and risk:** Net operating profit minus the interest charge on the use of machinery, equipment, and operating capital. This return figure shows the final return before a land charge is calculated. (Line L)

**Return to risk:** Return to land and risk minus a charge for land investment, i.e., the amount of gross returns left over after charges are made for every factor of production.

**Variable cost:** Expenses that vary with the level of production, such as labor, fuel, oil and repairs, fertilizer, and seed.

**Whole-farm budget:** Projected crop mix revenues and expenses for a production year. A projected plan and income statement.
